

# Identifying Risk Factors for Cardiovascular Disease

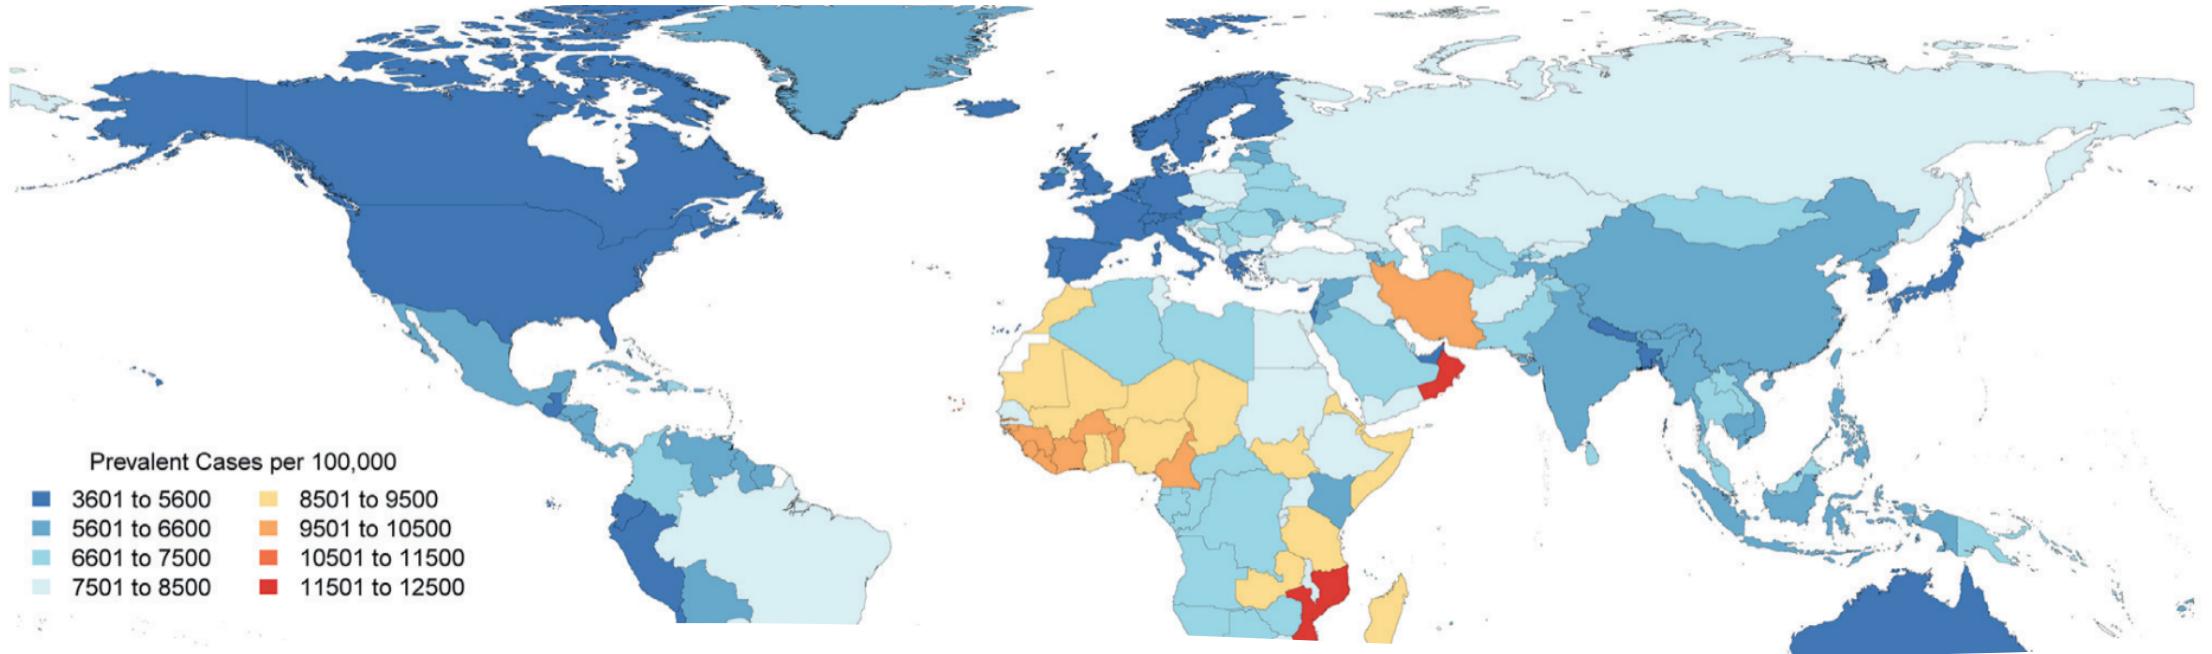

Xiaowu Dai and Saad Mouti

---

Joint work with Lisa R. Goldberg (Berkeley),  
and collaborators at University of Cambridge and Swiss Re Institute

Risk Seminar  
04/14/2020

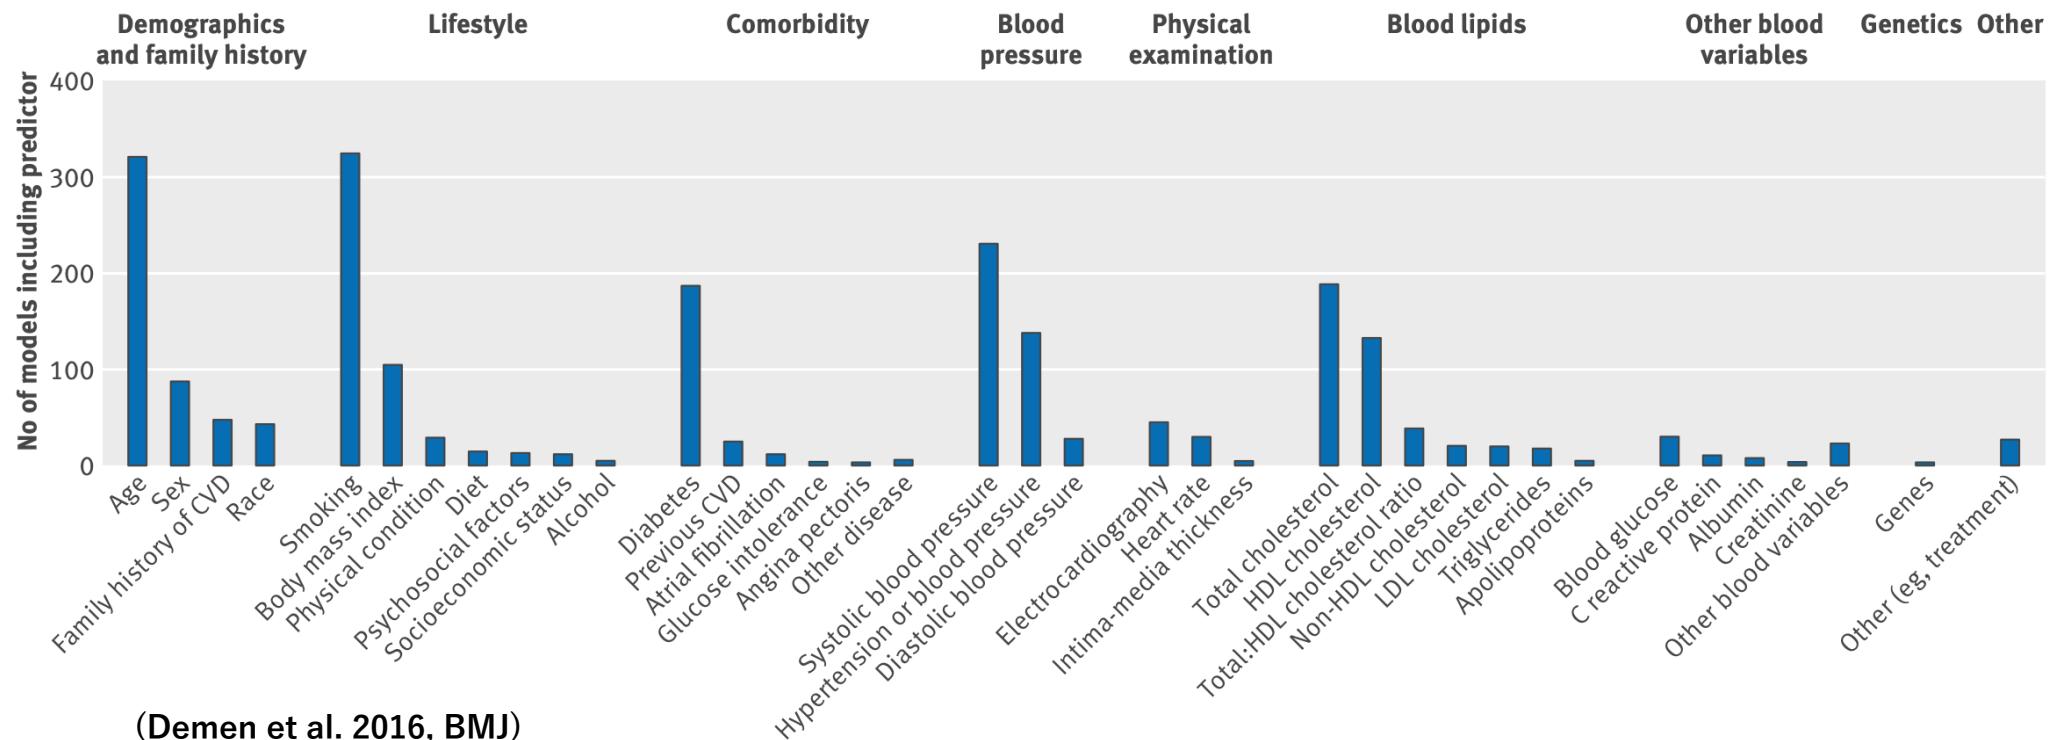

(Roth et al. 2017, JOURNAL OF THE AMERICAN COLLEGE OF CARDIOLOGY)

## Cardiovascular Disease (CVD)

- A leading cause of death in the world
- United Nations recognized CVD as a major concern for global health
- Identification of CVD related risk factors is a health priority
- Individual level interventions (WHO 2017)

# Goal: Statistical Methods for Identifying Risk Factors for CVD

- **Demographics** (age, gender, race, etc.)
- **Lifestyle** (smoking, bmi, diet, alcohol, etc.)
- **Comorbidity** (diabetes, other disease, etc.)
- **Blood pressure, blood lipids, genetics, stress, etc.**

(Demen et al. 2016, BMJ)

# Spurious Correlation

- High-density lipoprotein (HDL) cholesterol of higher levels is associated with low CVD risk
- But drugs that increase HDL (e.g., trapibs) do not significantly reduce CVD
- HDL is an indirect / surrogate marker, and HDL does not participate in causing or alleviating CVD  
**(Voight et al. 2012, The Lancet)**

**Our Approach:** Causal inference + Subsampling

# Causal Inference for CVD

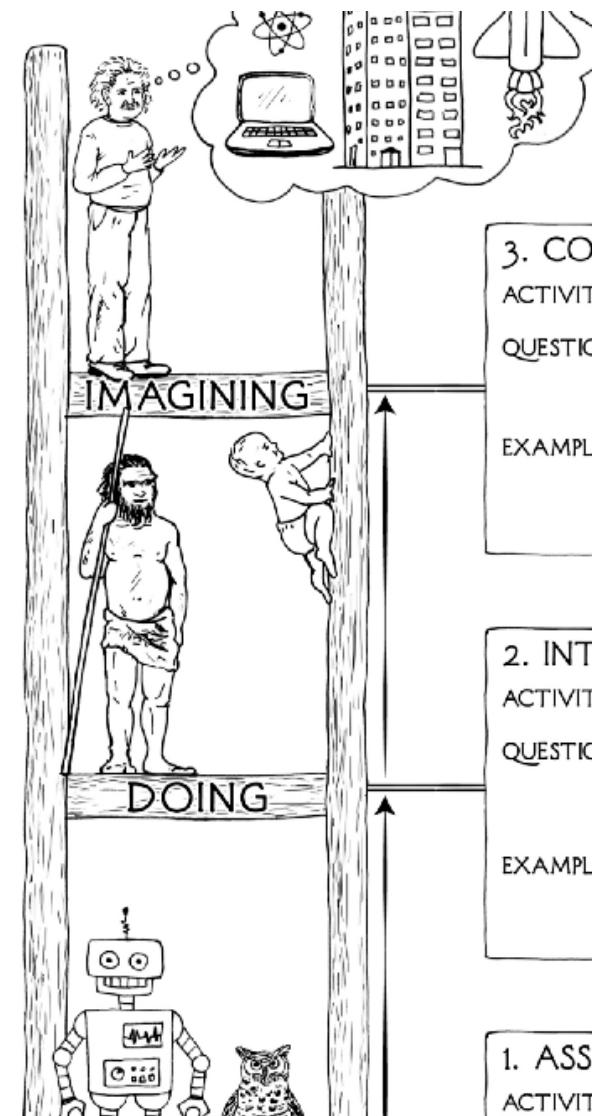

Causal inference → **Personalized** therapies in cardiology

**Related Work:** Mendelian Randomization

(van der Kann et al., 2016, J AM Coll Cardiol;  
Shameer et al., 2018, Heart)

- **Genetic** material is randomly inherited
- Alcohol intake (**Holmes et al. 2014, BMJ**)
- LDL cholesterol (**Holmes et al. 2015, Eur Heart J**)

**Our Focus:** Demographics, Lifestyle, Comorbidity,  
Blood pressure, Blood lipids.

Pearl (2018)

## 3. COUNTERFACTUALS

**ACTIVITY:** Imagining, Retrospection, Understanding

**QUESTIONS:** *What if I had done ...? Why?*  
(Was it X that caused Y? What if X had not occurred? What if I had acted differently?)

**EXAMPLES:** Was it the aspirin that stopped my headache?  
Would Kennedy be alive if Oswald had not killed him? What if I had not smoked for the last 2 years?

## 2. INTERVENTION

**ACTIVITY:** Doing, Intervening

**QUESTIONS:** *What if I do ...? How?*  
(What would Y be if I do X?  
How can I make Y happen?)

**EXAMPLES:** If I take aspirin, will my headache be cured?  
What if we ban cigarettes?

## 1. ASSOCIATION

**ACTIVITY:** Seeing, Observing

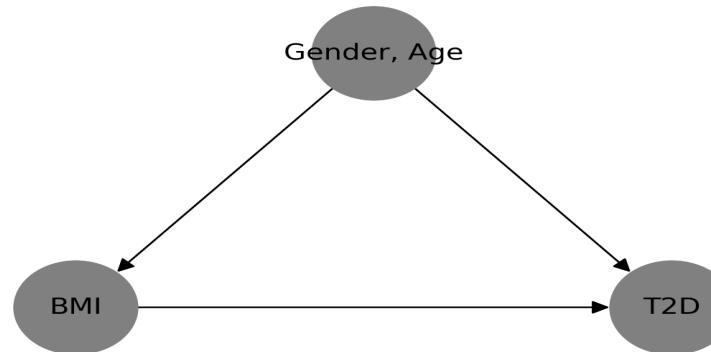

Q1: Does obesity  
cause type 2  
diabetes?

# Matching Method

--A method for causal inference using observational data

- **Potential outcome:**  $\mathbb{E}(Y(1)|X) - \mathbb{E}(Y(0)|X)$   
 $Y(1)$  : outcome if receiving the treatment  
 $Y(0)$  : outcome if receiving the control
- **Average treatment effect (ATE):** effect for all individuals including both treatment and control
- **Assumption 1: Stable unit treatment value assumption** (Rubin, 1980)  
*Outcomes of one individual are not affected by treatment assignment of any other individuals*
- **Assumption 2: Strong ignorable treatment assignment condition** (Rosenbaum and Rubin, 1983)  
(2.1) *Treatment assignment is independent of the potential outcomes given the covariates*  
(2.2) *Non-vanishing probability of receiving each treatment for all values of covariates*

**Goal of matching method:** replicate a randomized experiment as closely as possible by obtaining treated and control groups with similar covariate distributions

# Dr. David Unwin, MD

Dr. David Unwin, MD, is an award-winning general practitioner (or family doctor) known for pioneering the low-carb approach in his profession in the UK.

In 2016 he won the prestigious [NHS Innovator of the Year](#) award for his work with diabetes patients. On top of that, Dr. Unwin is the medical advisor at the popular [Low Carb Program](#) and is doing his best to [spread knowledge about low carb](#) among doctors, dietitians and nurses.

In 2017/18, his practice saved £57,000 on drugs for type 2 diabetes, hypertension and other conditions by offering patients a dietary alternative to medications.

## Data Collection

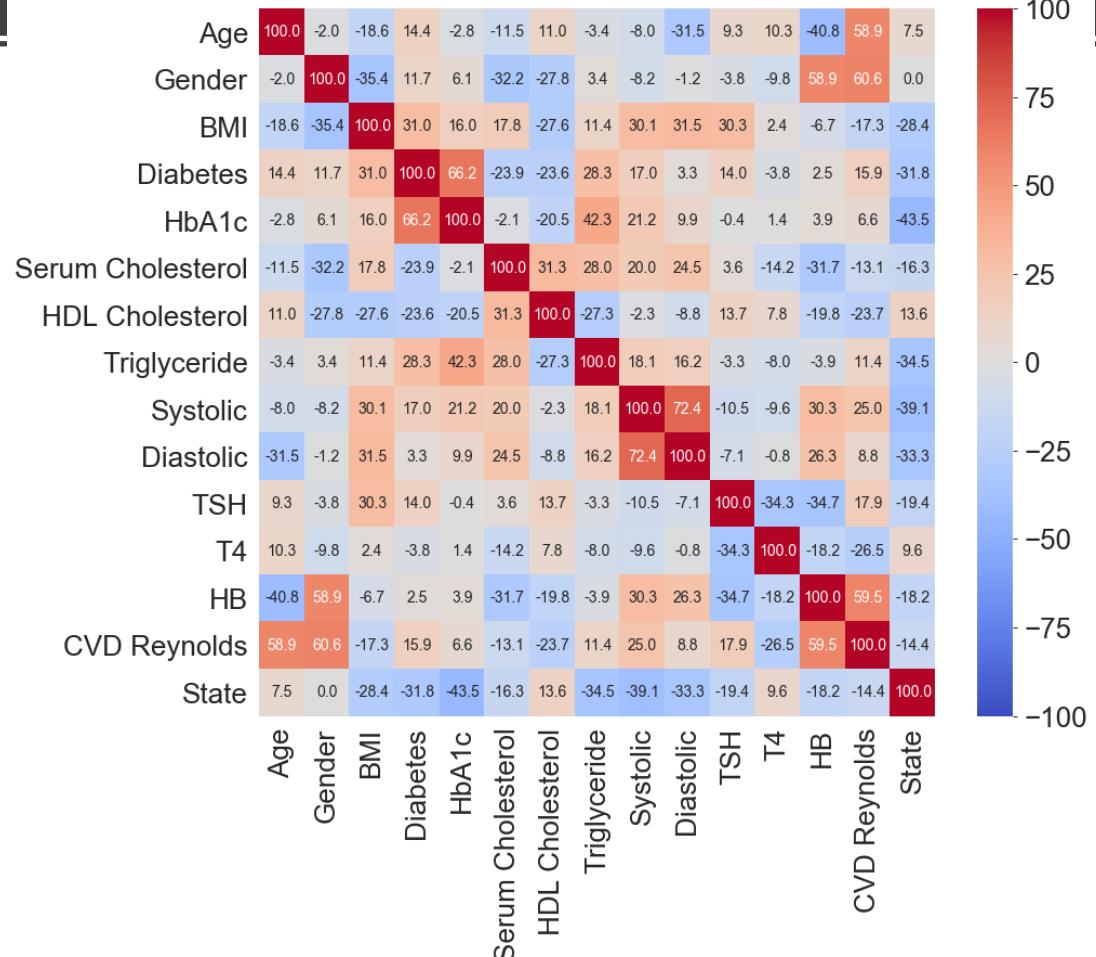

- 256 subjects in London, UK
- Dr. Unwin's office collect data for two time points
  - Time 0: without low-carb diet
  - Time 1: with low-carb diet

# Data Summary

## Summary Statistics

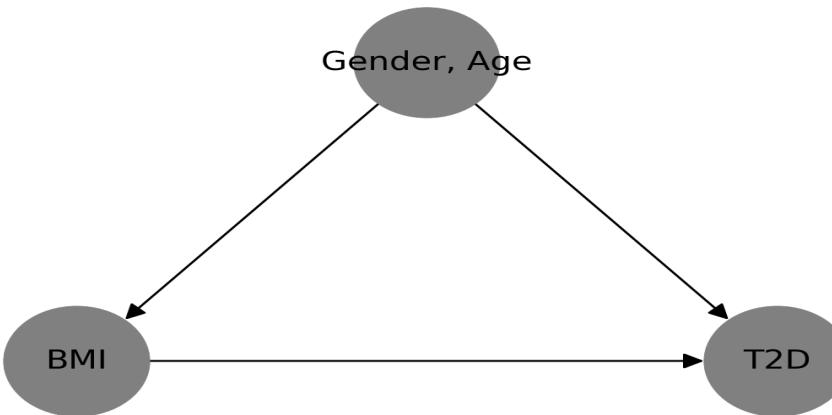

State	Variable	count	mean	std	min	25%	50%	75%	max

Correlation Heatmap

# I-Randomization Algorithm

(i.e., self-randomization by combining *subsampling* and *permutation test*)

**Motivation:** Using **two observations** of each subject (i.e.  $2^*256$  samples) would violate the *Stable Unit Treatment Value Assumption*.

**Idea:** *Stage 1*--Using **subsampling** to mimic a randomized experiment by randomly pick either one of the two observations for each subject (i.e.,  $2^*256$  subsamples).  
Repeat the subsampling M times and take average of ATEs.

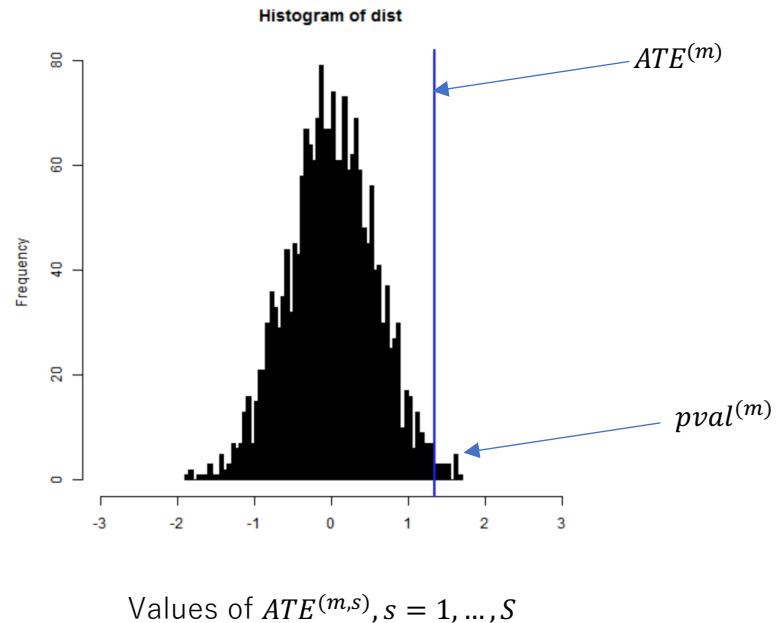

*Stage 2*--For each subsampling, using **permutation test** to evaluate the significance of ATE (e.g., obtaining p-values).

*Stage 3*--**Online FDR control** for multiple testing (e.g., LORD algorithm by Javanmard and Montanari, 2018).

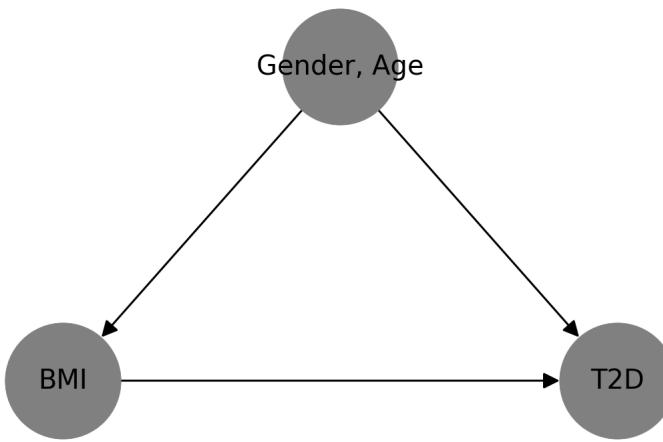

# I-Randomization

## Pseudo Code

1. Start from a matrix with  $2N$  rows where each data point is identified by the patient ID and the state (0 for the initial date and 1 for final date).
2. For  $m$  in 1 to  $M$ :
  - (a) Sample a binary vector of length  $N$ ; the index if the patient's ID and the value is the state (sample without replacement).
  - (b) Select the corresponding subsample  $m$ .
  - (c) Calculate  $ATE^{(m)}$ .
  - (d) For  $s$  in 1 to  $S$ :
    - Shuffle the vector of treatment.
    - Calculate  $ATE^{(m,s)}$  for the shuffle  $s$  of the treatment from subsample  $m$ .
  - (e) Calculate the p-value  $pval^{(m)}$  for the one-tailed test for the null hypothesis of no treatment effect, estimated by  $\frac{1}{S} \sum_{s=1}^S \mathbb{1}_{ATE^{(m,s)} > (resp. s <) ATE^{(m)}}$ .
3. Calculate the averaged  $ATE = \frac{1}{M} \sum_{m=1}^M ATE^{(m)}$  and averaged p-value =  $\frac{1}{M} \sum_{m=1}^M pval^{(m)}$ .

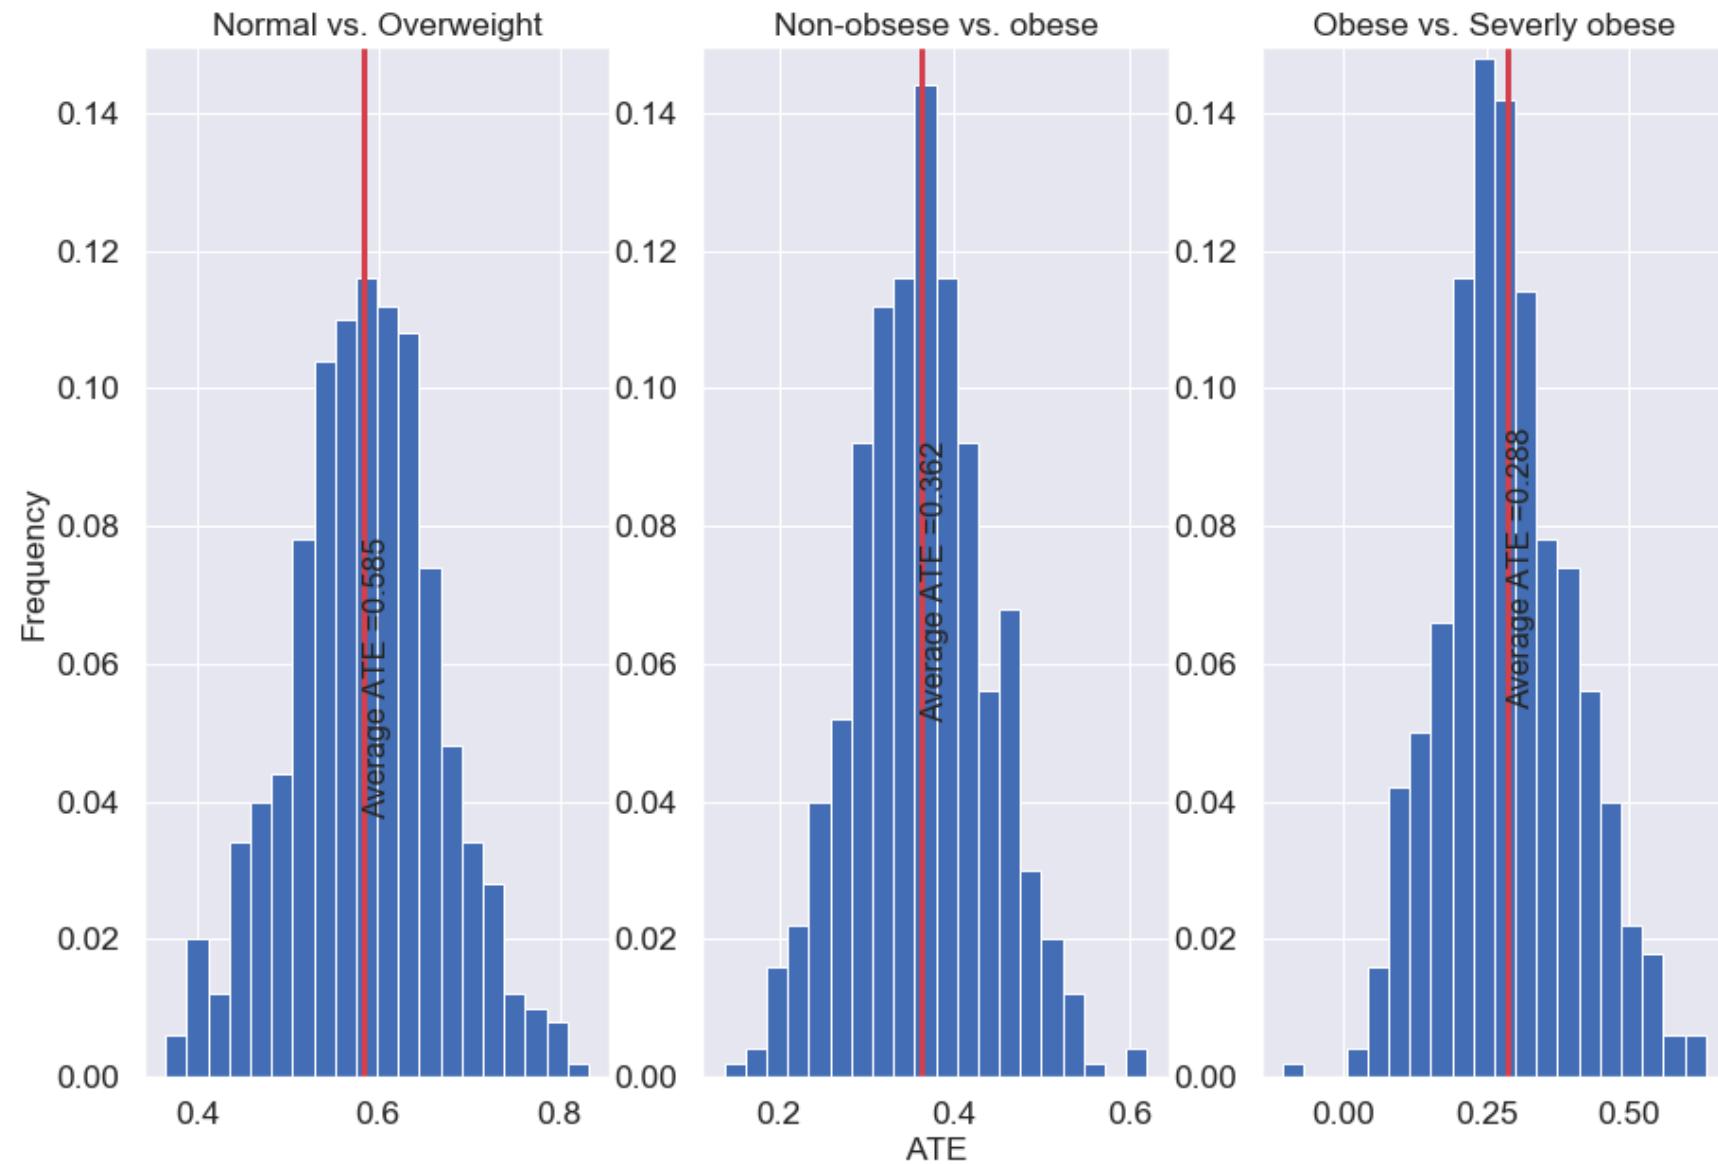

# Experiment Result

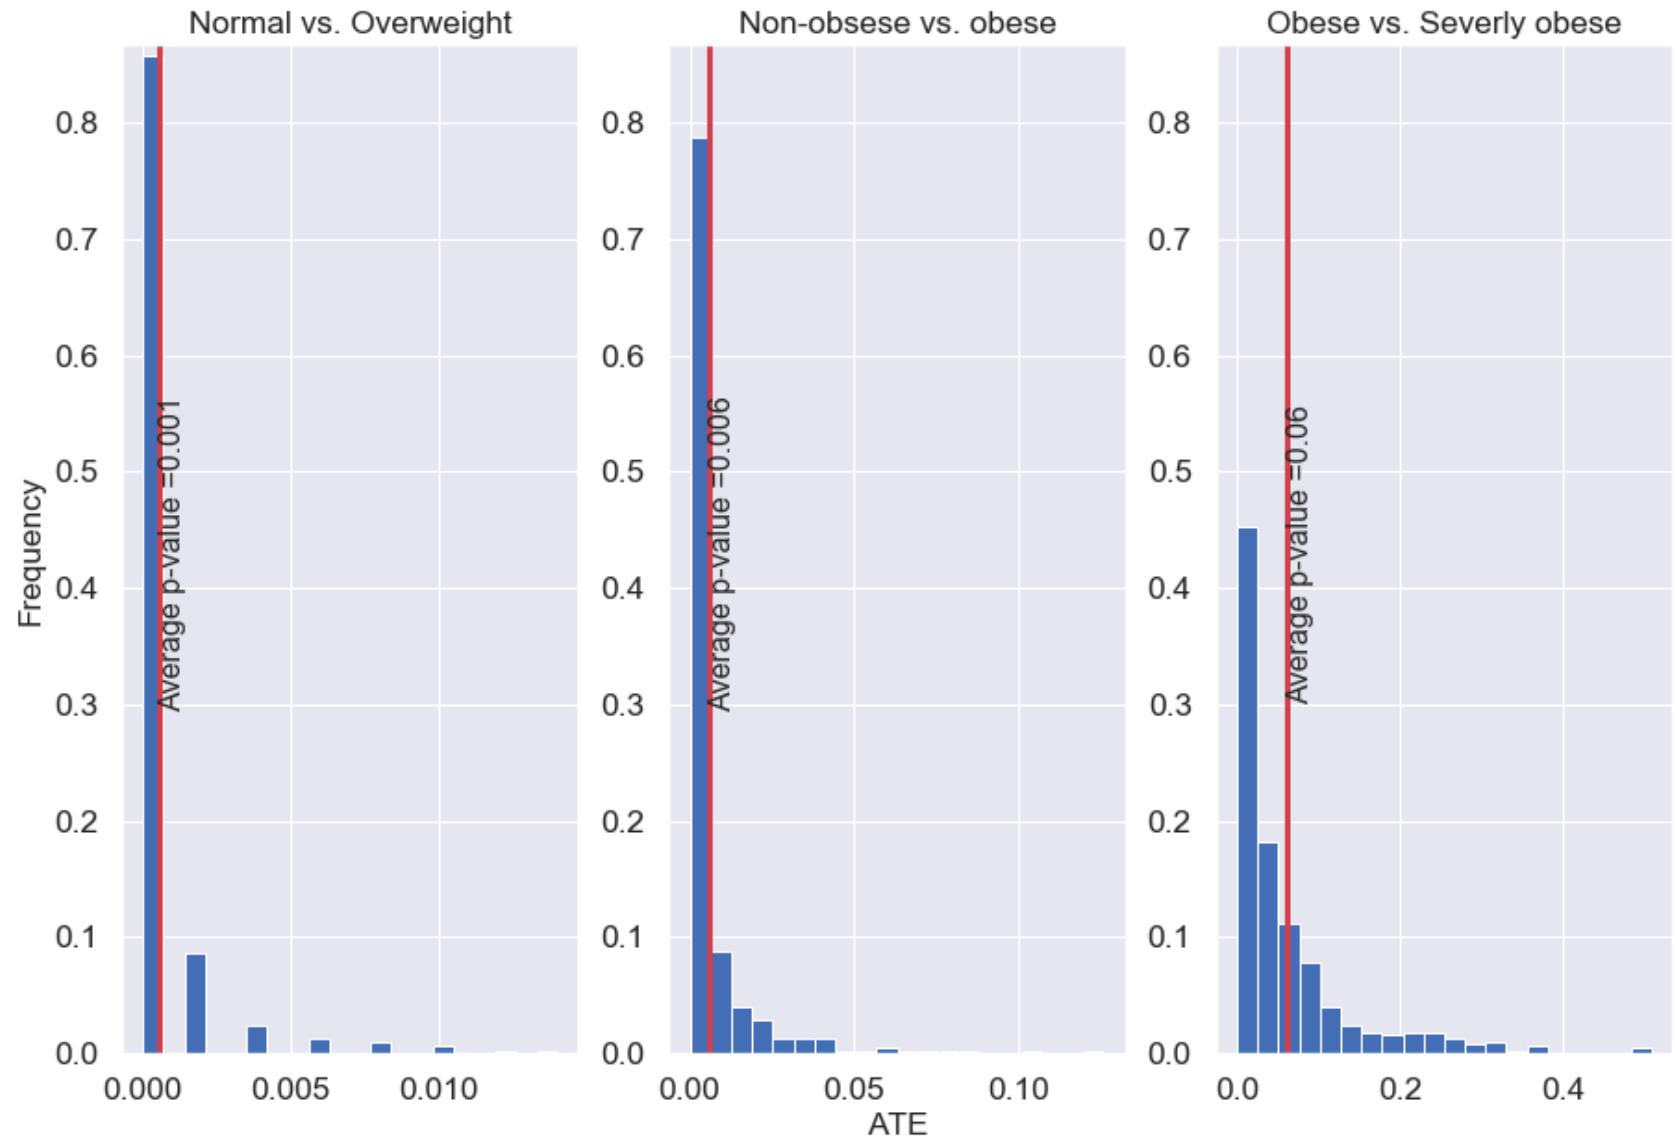

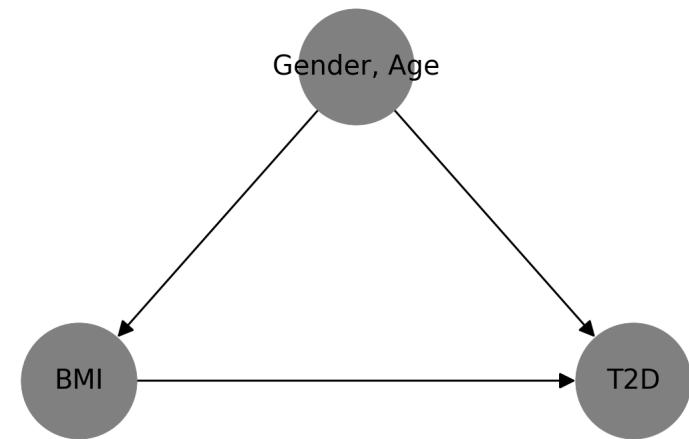

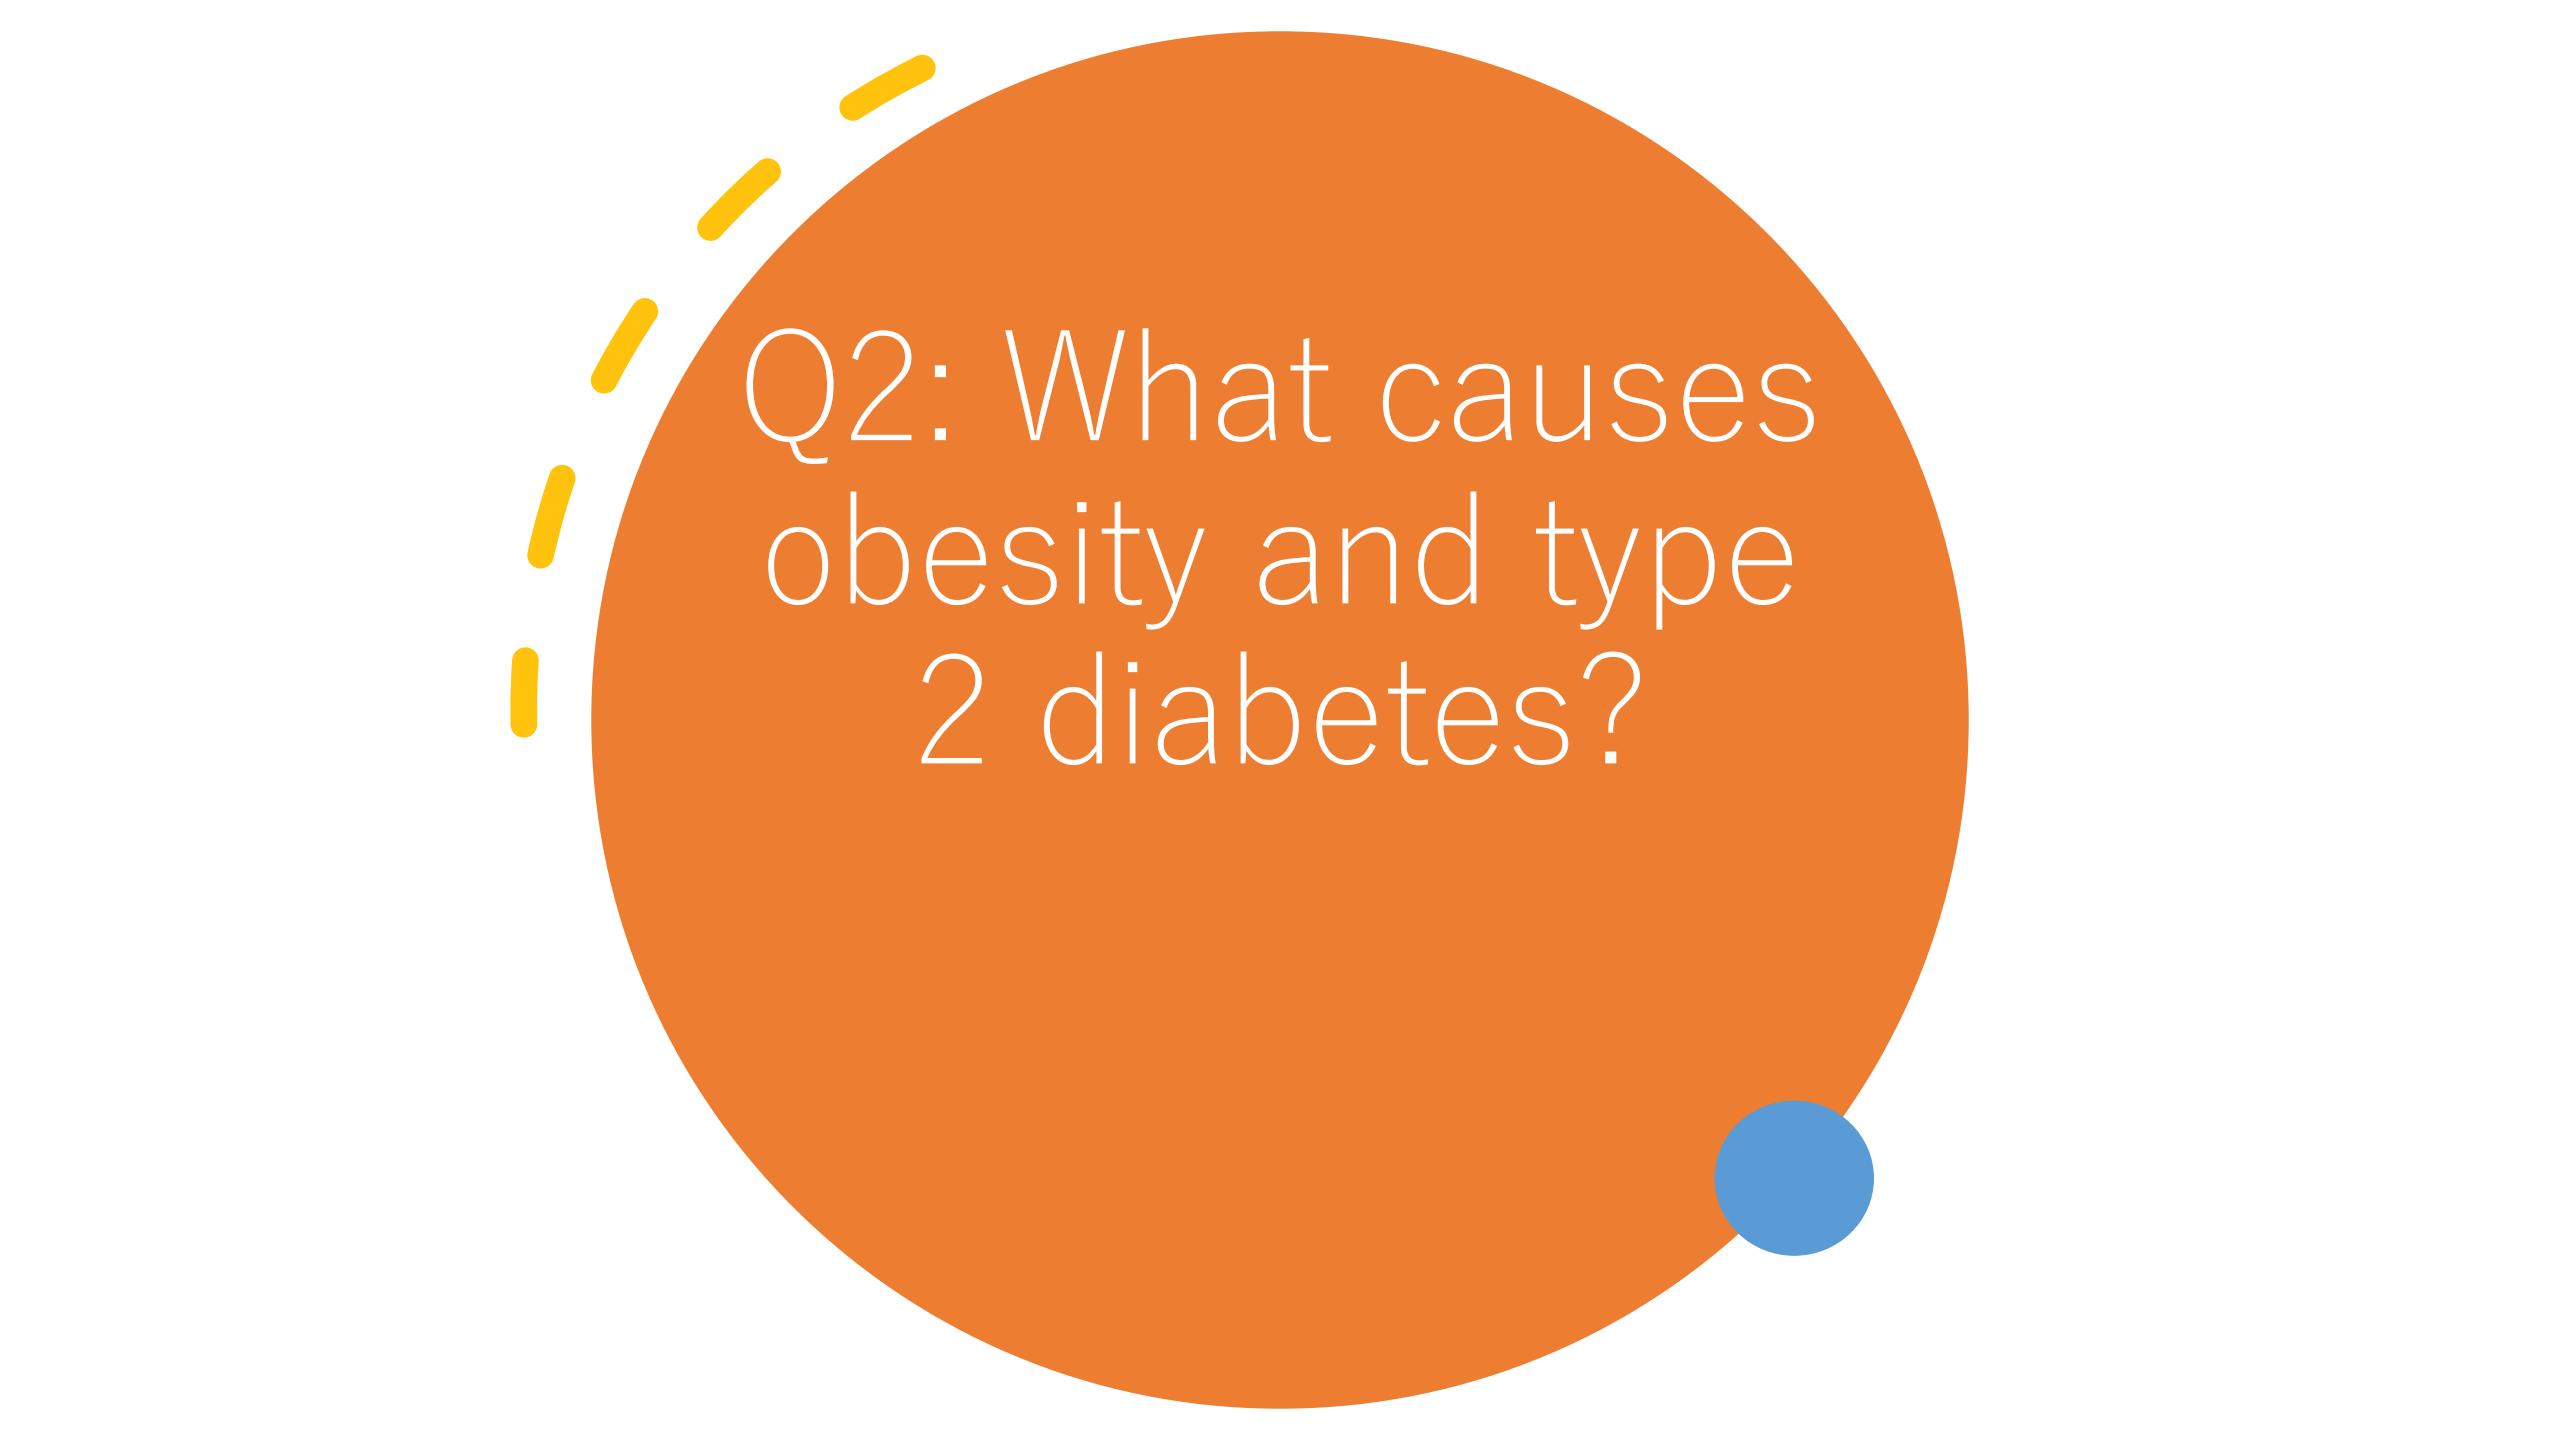

$BMI = \begin{cases} \text{Normal } (< 25) \\ \text{Overweight } [25, 30] \\ \text{Obese } [30, 35] \\ \text{Severe Obese } > 35 \end{cases}$

$T2D = \begin{cases} \text{Non-Diabetic} \\ \text{Pre-Diabetes} \\ \text{Diabetes} \end{cases}$

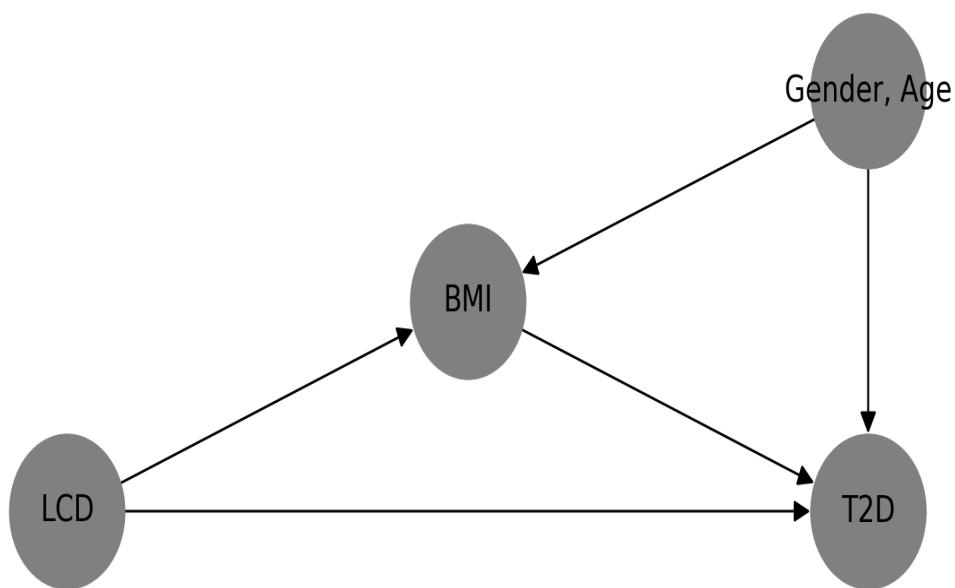

# Significance Test

Q2: What causes  
obesity and type  
2 diabetes?

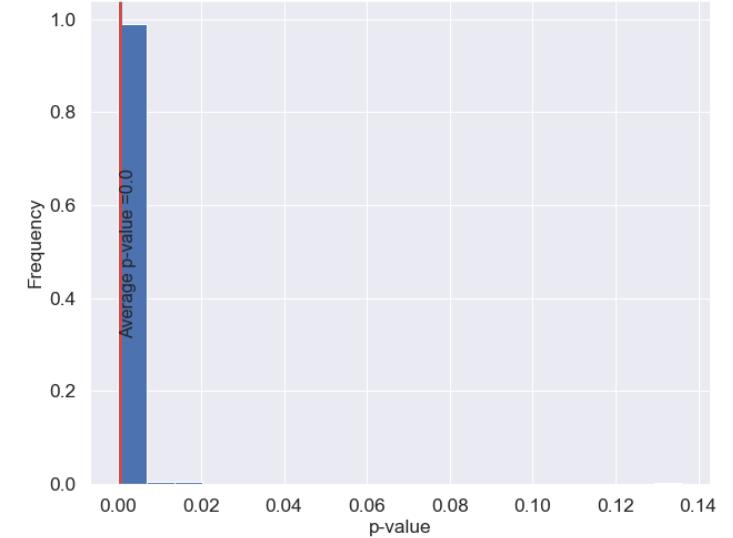

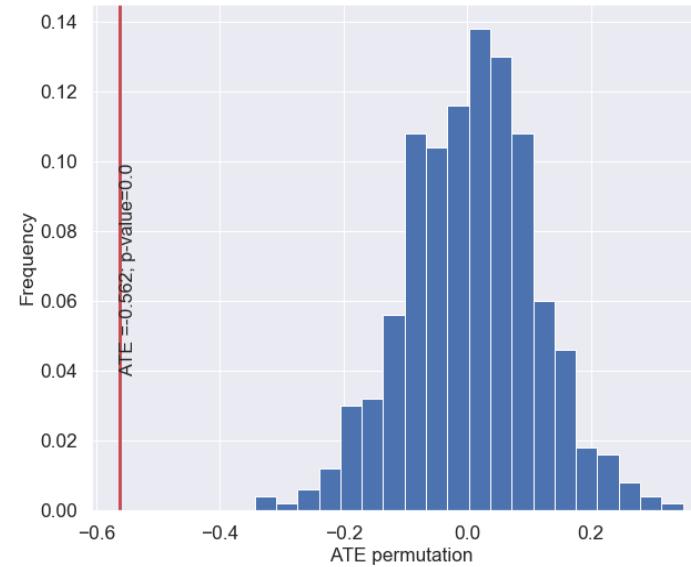

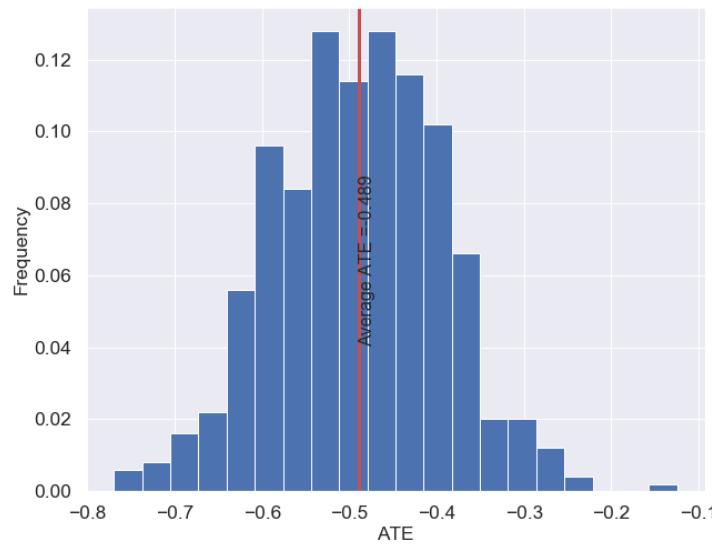

# Is obesity bad for type 2 diabetes?

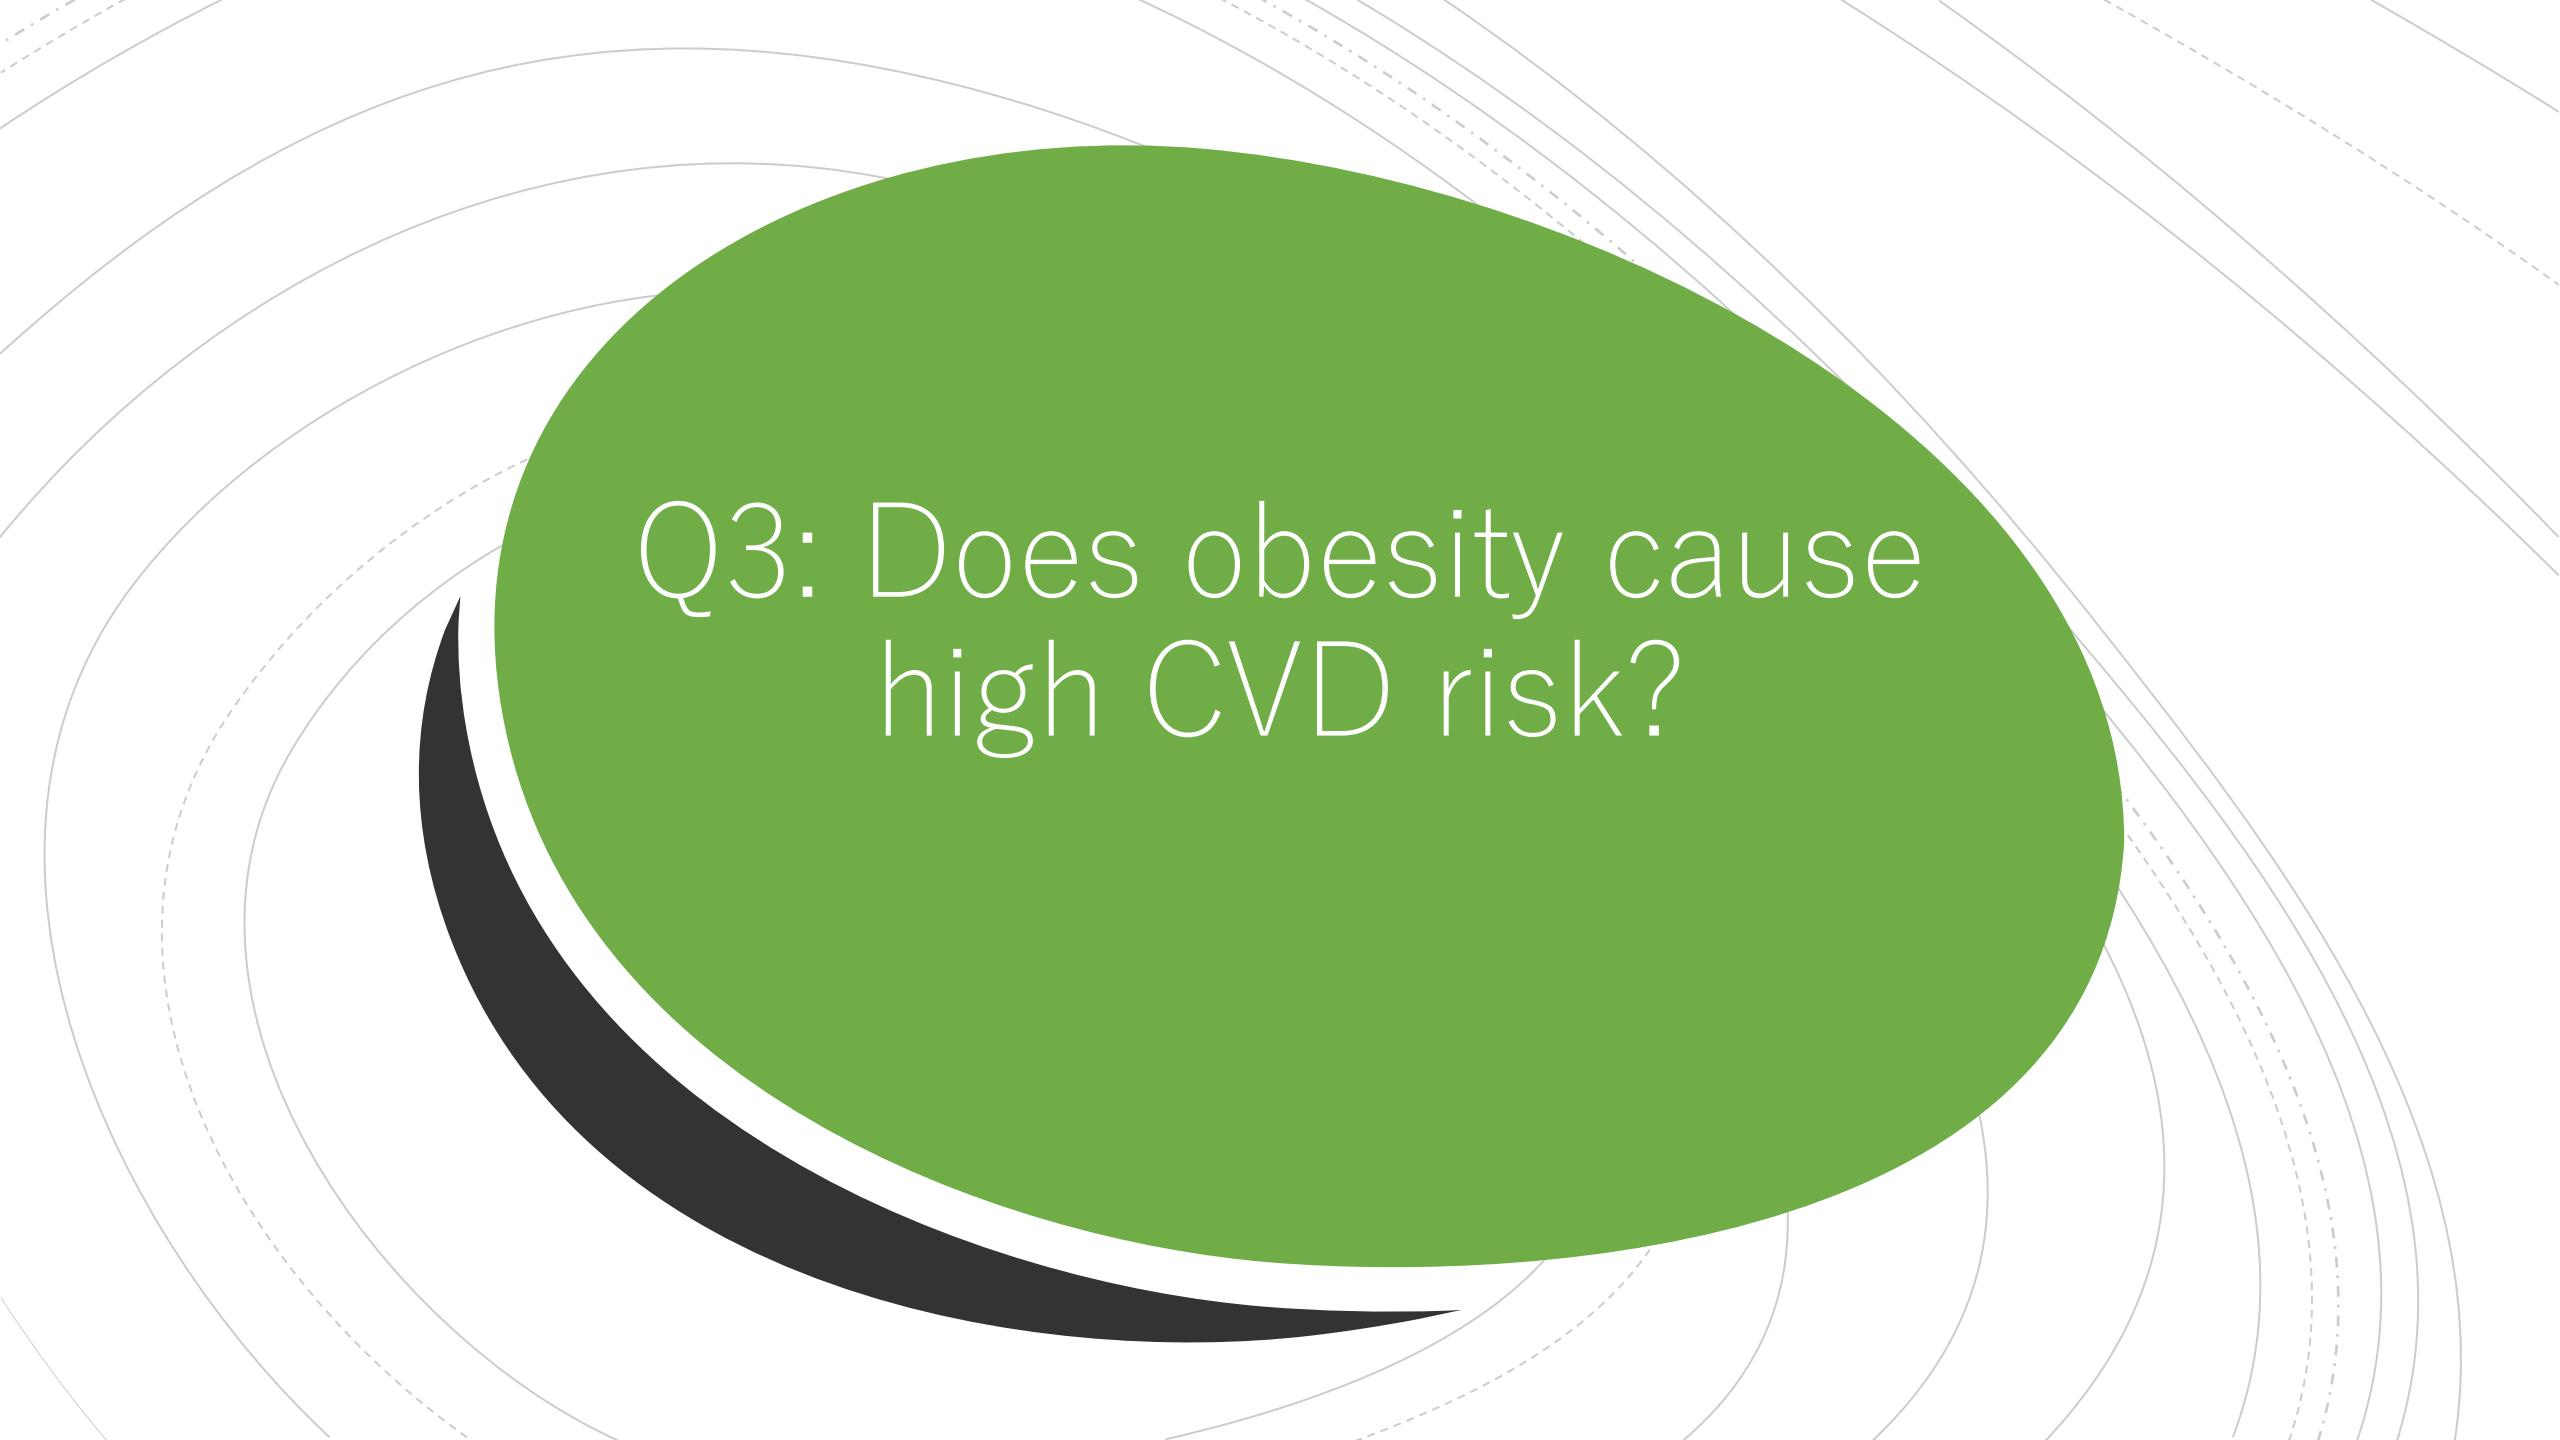

- BMI is a mediator between low-carbs diet and type-2 diabetes
  - To estimate the effect of LCD on T2D we can:
    - Compute ATE without controlling for anything (BMI is a collider)
    - Control for all of BMI, Gender, and Age
- That's what we want to do

# Yes, obesity is bad for type 2 diabetes ... (counterfactual)

Distribution of the ATE from 500 subsamples (left), from one PT (middle),  
and of the p-value from 500 PT (right)

Q3: Does obesity cause  
high CVD risk?

# Reynolds Risk Score for CVD

P.M. Ridker, et al., 2007, JAMA

The screenshot shows the Reynolds Risk Score calculator interface. At the top, it says "Reynolds Risk Score: Calculating Heart and Stroke Risk for Women and Men". Below that are three buttons: "Home", "Calculator", and "FAQ". The main content area has a red header: "If you are healthy and without diabetes, the Reynolds Risk Score is designed to predict your risk of having a future heart attack, stroke, or other major heart disease in the next 10 years." A note below states: "In addition to your age, blood pressure, cholesterol levels and whether you currently smoke, the Reynolds Risk Score uses information from two other risk factors, a blood test called hsCRP (a measure of inflammation) and whether or not either of your parents had a heart attack before they reached age 60 (a measure of genetic risk). To calculate your risk, fill in the information below with your most recent values. [Click here](#) for help filling the information." The form fields include: "Gender" (radio buttons for Male and Female); "Age" (text input field with placeholder "Years (Maximum age must be 80)"); "Do you currently smoke?" (radio buttons for Yes and No); "Systolic Blood Pressure (SBP)" (text input field with unit "mm/Hg"); "Total Cholesterol" (text input field with unit "mg/DL (or) mmol/L"); "HDL or "Good" Cholesterol" (text input field with unit "mg/DL (or) mmol/L"); "High Sensitivity C-Reactive Protein (hsCRP)" (text input field with unit "mg/L"); "Did your Mother or Father have a heart attack before age 60 ?" (radio buttons for Yes and No); and a "Calculate 10 year risk" button at the bottom.

## Assumptions due to limited data

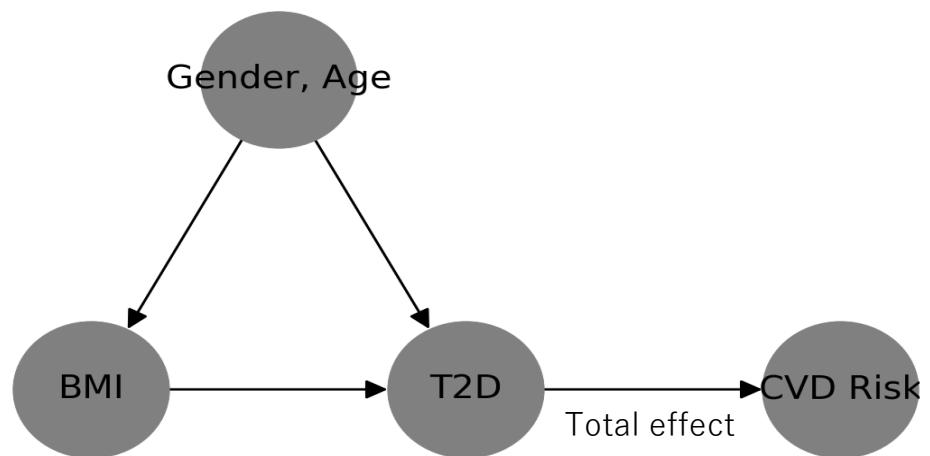

- Assume all patients are non-smokers
- Ignore hsCRP
- Ignore information about family history

Reynolds Risk Score (RRS) does not include diabetes information

We can also use Blood Pressure (BP) or Cholesterol (HDL and Total) as the outcome

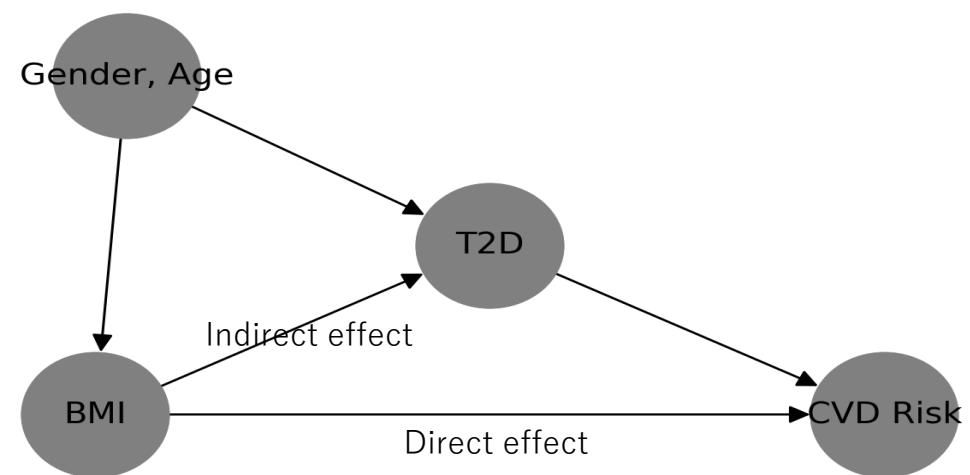

# Impact of obesity on CVD Risk

## Impact of Obesity (BMI) on CVD Risk

- BMI diet impacts CVD Risk through T2D
  - T2D is a mediator and no direct path from LCD to CVD Risk
  - We control for Gender, and Age

CVD Risk | BMI; Gender, Age

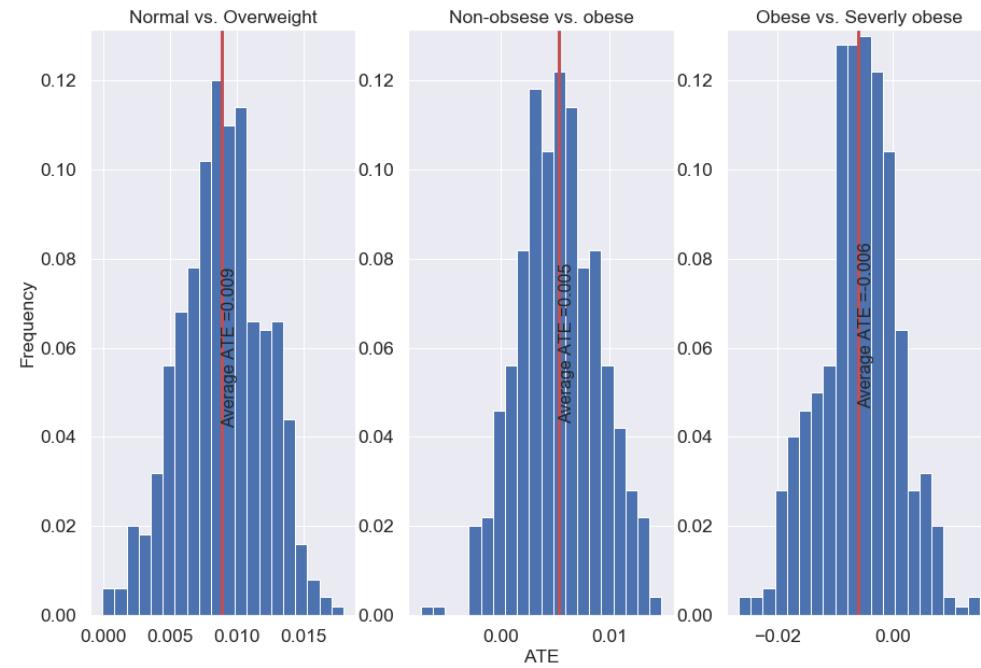

- BMI diet impacts CVD Risk through T2D
  - T2D is a mediator with a direct path from LCD to CVD Risk
  - We control for all of Gender, Age, and T2D

CVD Risk | BMI; Gender, Age, T2D

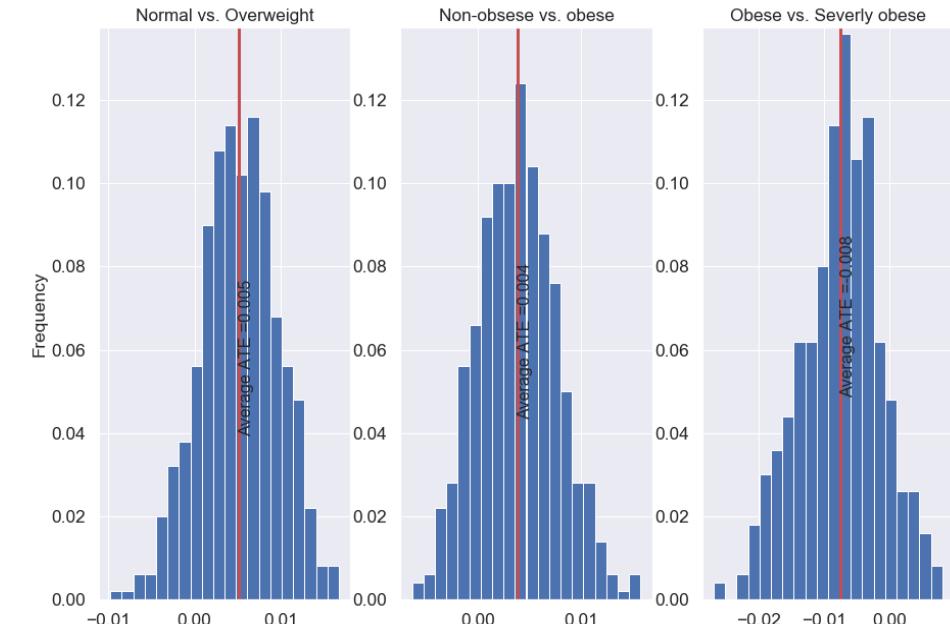

# Impact of obesity on CVD Risk

## Distribution of subsamples

RRS | BMI; Gender, Age

RRS | BMI; Gender, Age, T2D

Indirect causal effect = Total effect – Direct effect

$$0.009 - 0.005 = 0.004 \text{ (Normal vs. Overweight)}$$

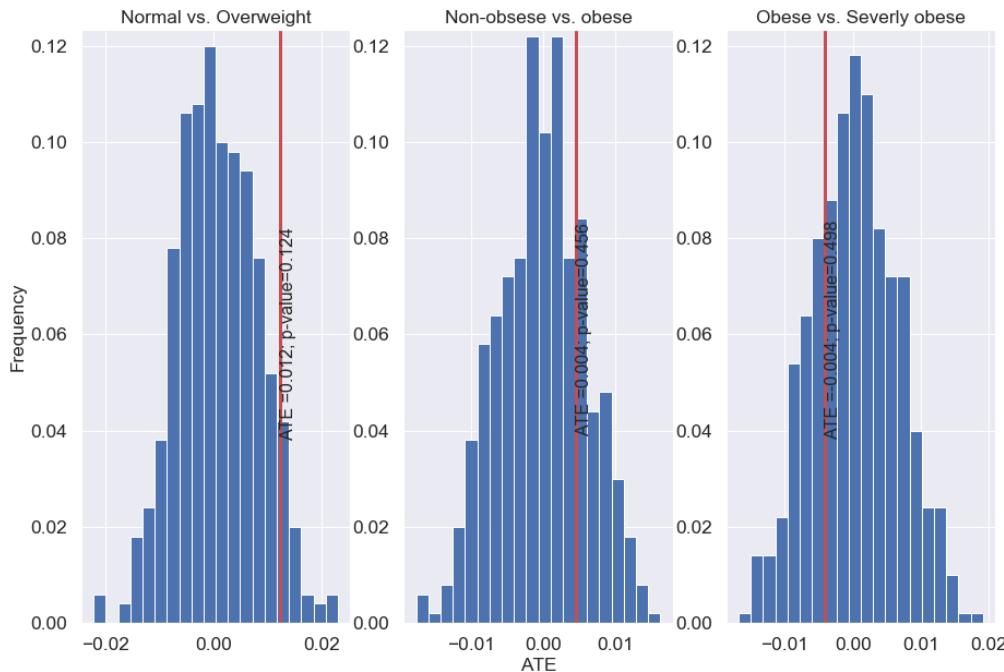

$$0.005 - 0.004 = 0.001 \text{ (Non-obese vs. Obese)}$$

$$0.006 - 0.008 = -0.002 \text{ (Obese vs. Severely obese)}$$

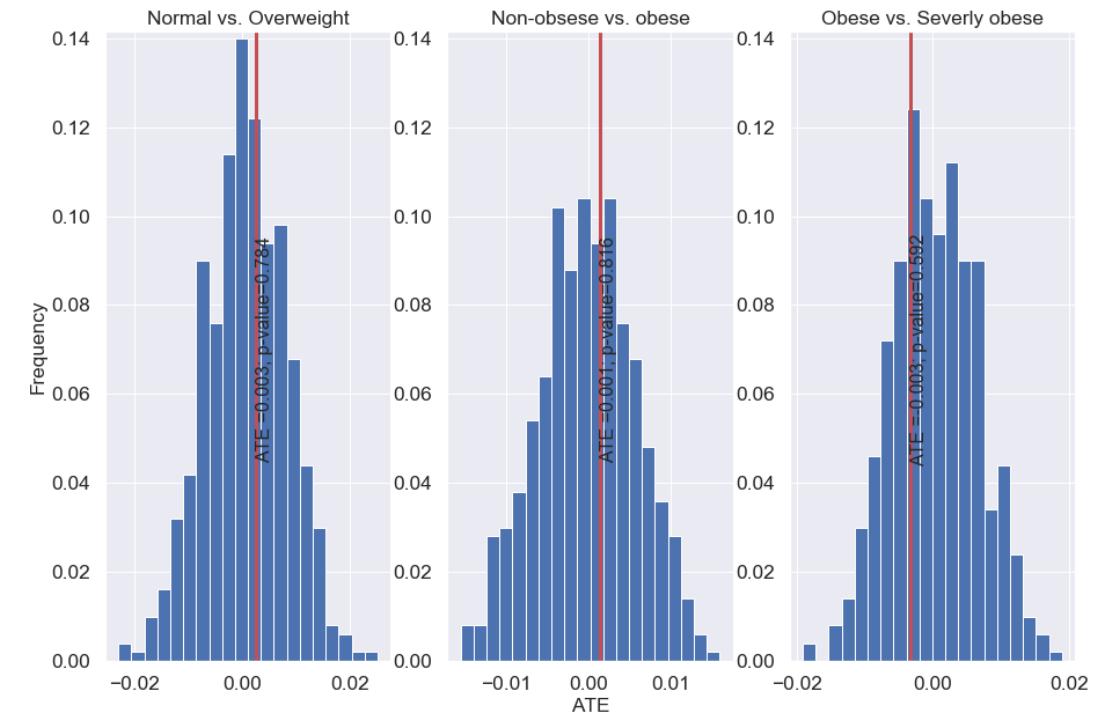

# Impact of obesity on CVD Risk

## Distribution of one permutation test

RRS | BMI; Gender, Age

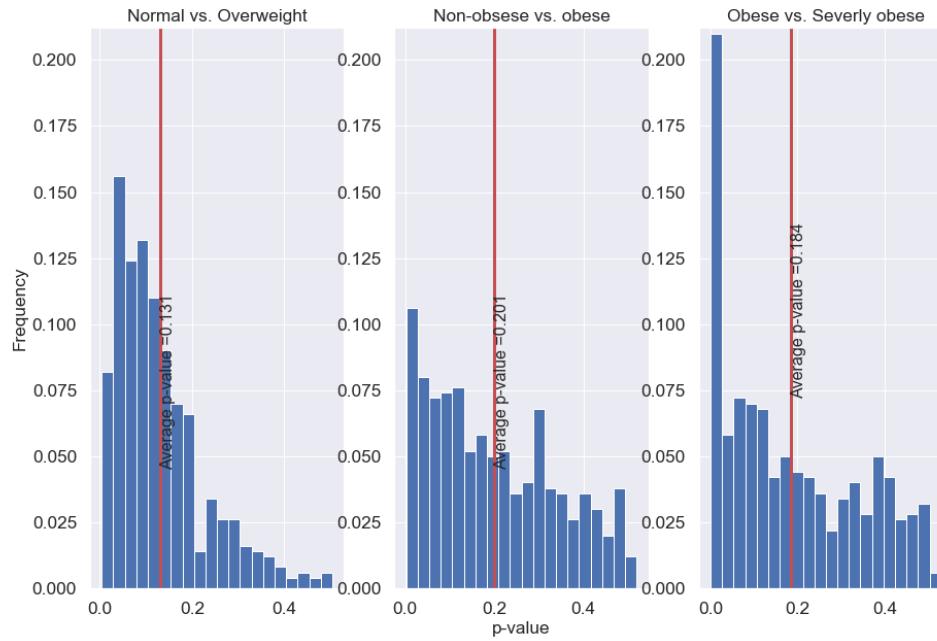

RRS | BMI; Gender, Age, T2D

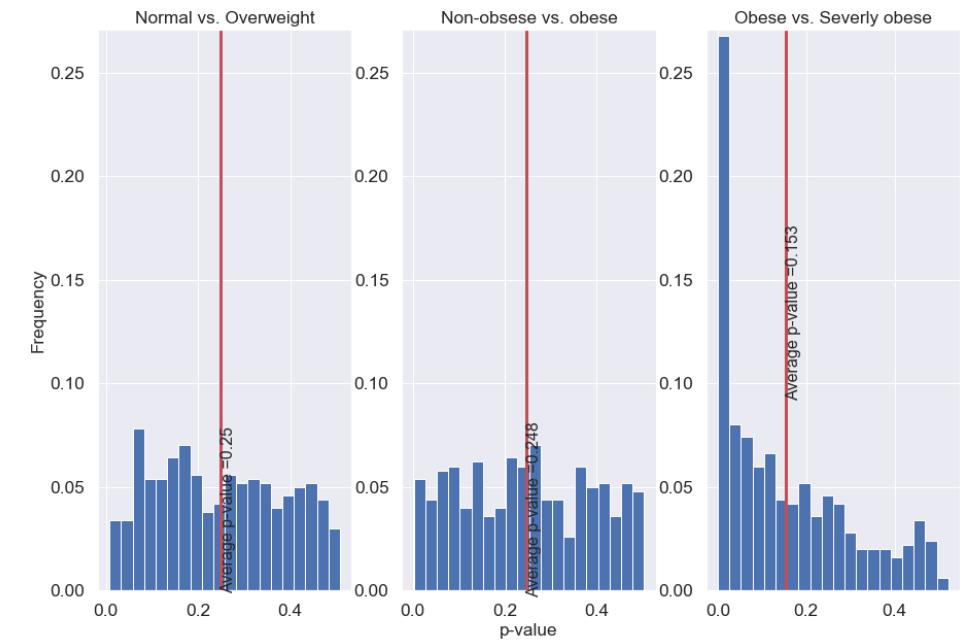

# Impact of obesity on CVD Risk

## Distribution of p-values

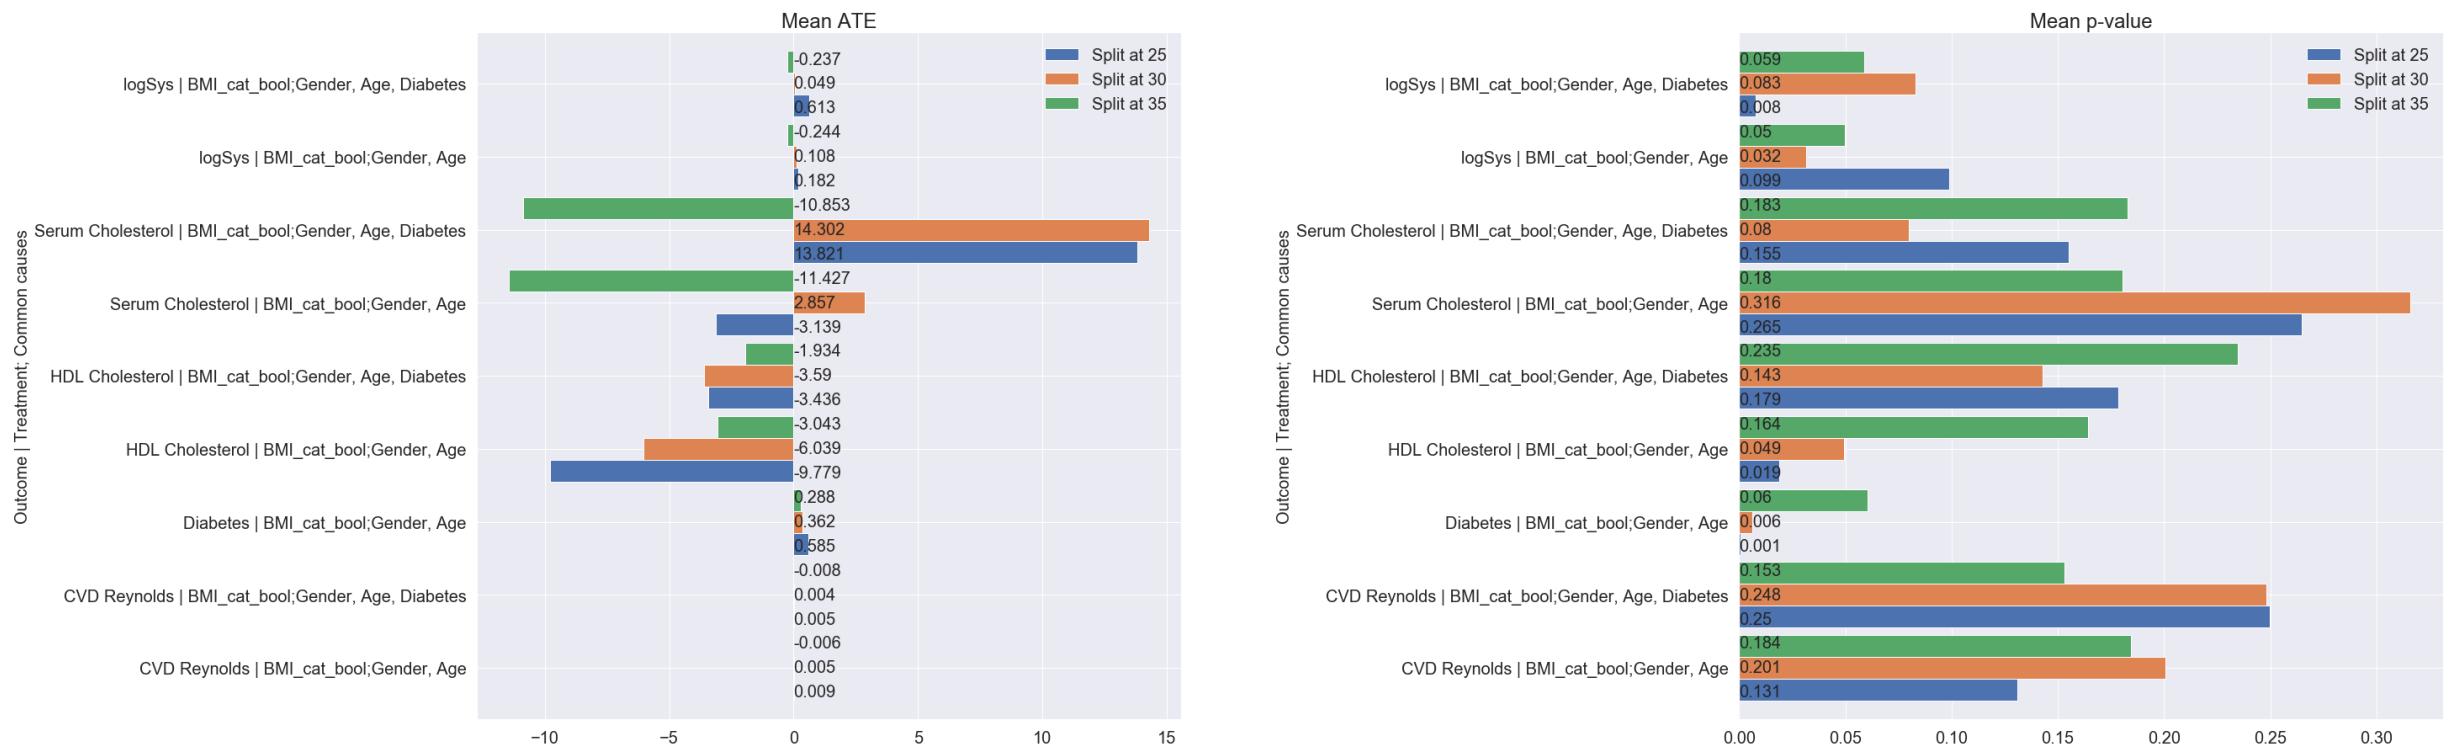

RRS | BMI; Gender, Age

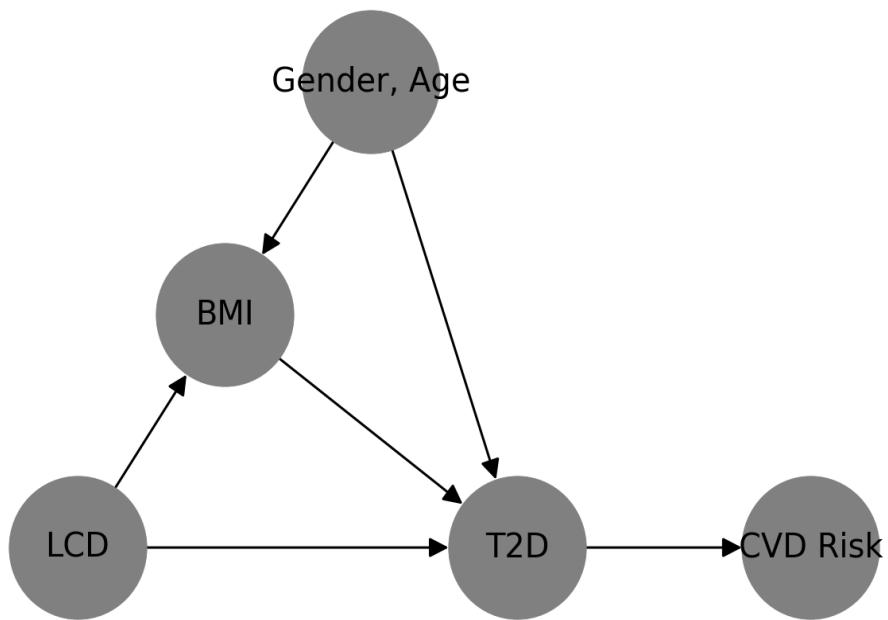

RRS | BMI; Gender, Age, T2D

# Summary of the Effect of Obesity

# Low-Carb is promising for lowering CVD risk !

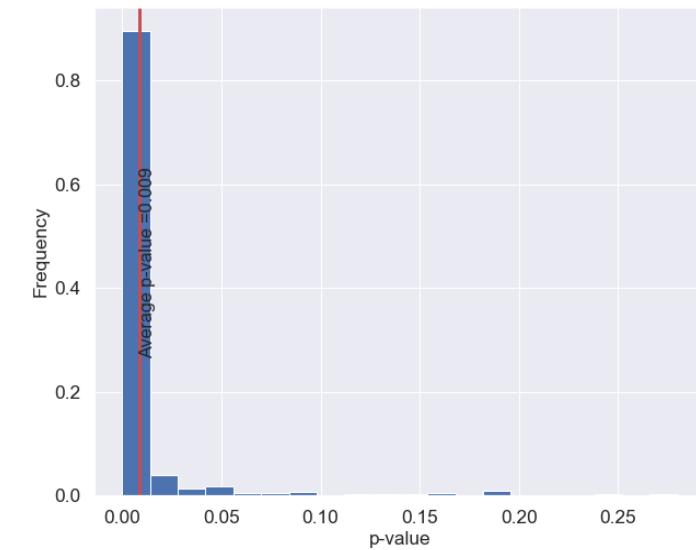

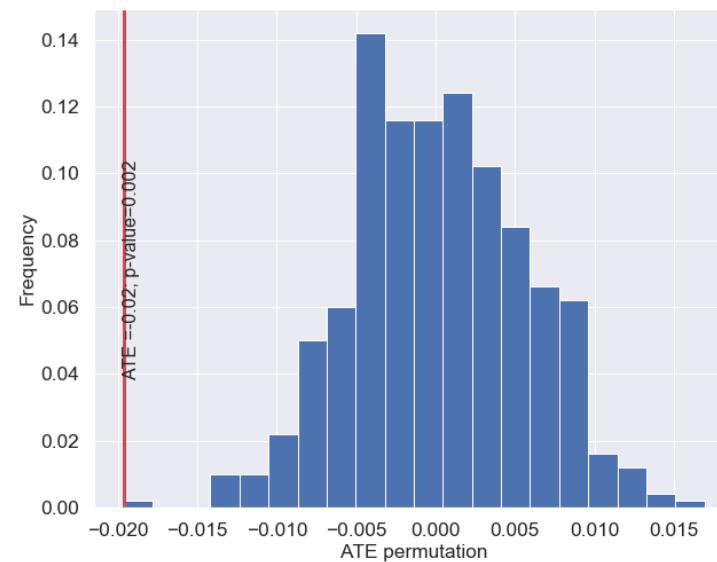

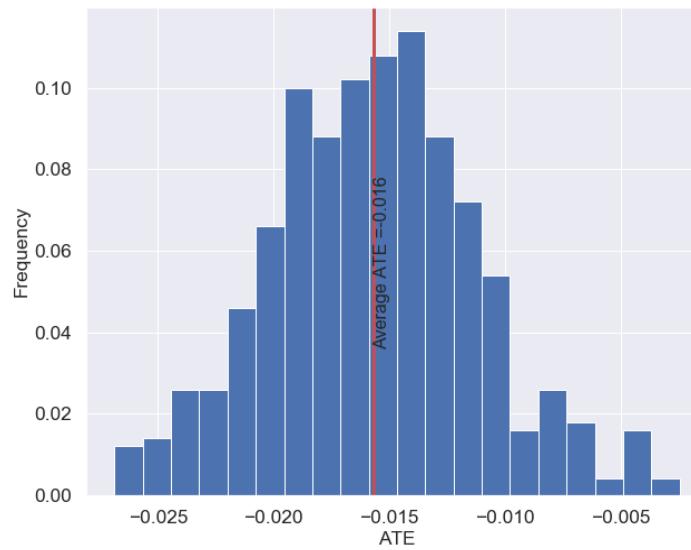

## Impact of low-carb diet on CVD Risk

- Low-carb diet impacts CVD Risk through T2D
  - T2D is a mediator
  - No direct path from LCD to CVD Risk
  - Control for BMI, Gender, and Age

RRS | LCD; Gender, Age, BMI

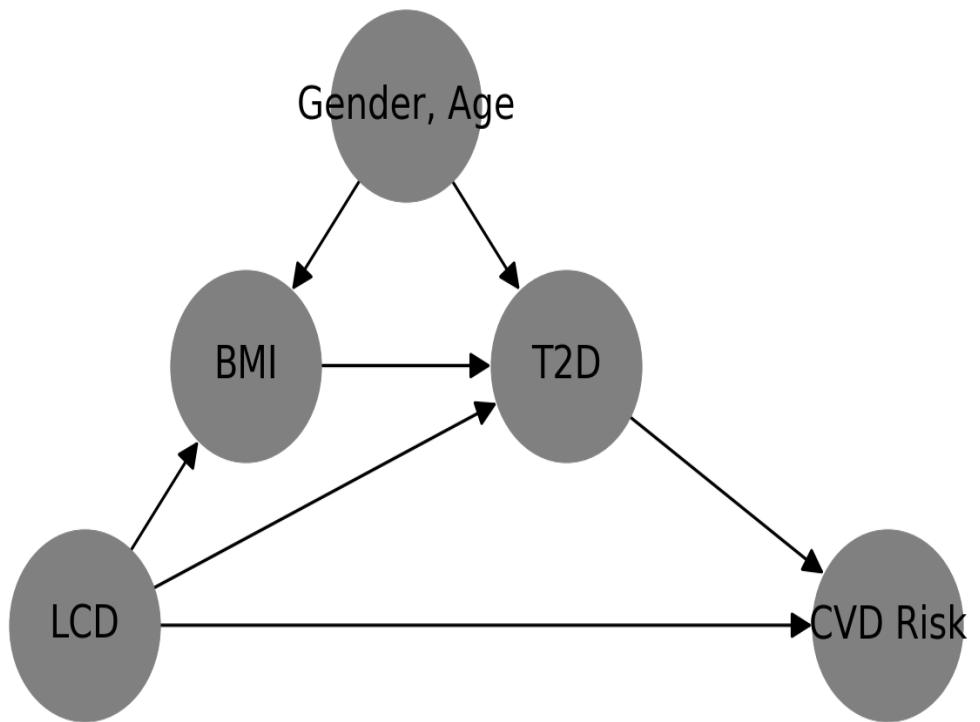

# Impact of Low-Carb Diet on CVD risk

RRS | LCD; Gender, Age, BMI

Distribution of the ATE from 500 subsamples (left), from one PT (middle),  
and of the p-value from 500 PT (right)

# Low-Carb is promising for lowering CVD risk !

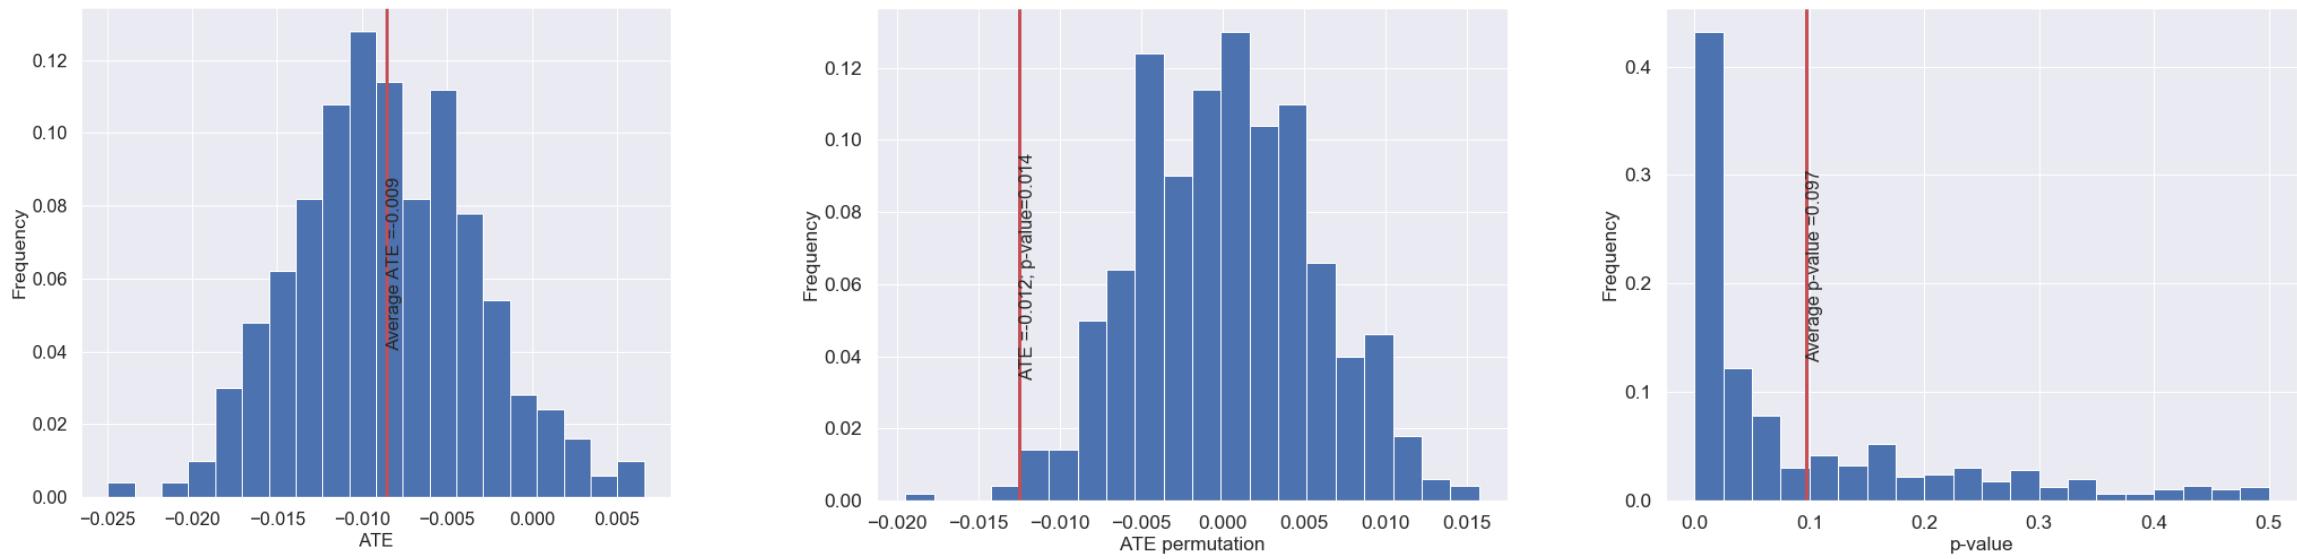

## Impact of low-carb diet on CVD Risk

- Low-carb diet impacts CVD Risk both directly and indirectly through
  - T2D is a mediator
  - There is also a direct path from LCD to CVD Risk
  - We control for Gender, Age, and T2D

RRS | LCD; Gender, Age, BMI, T2D

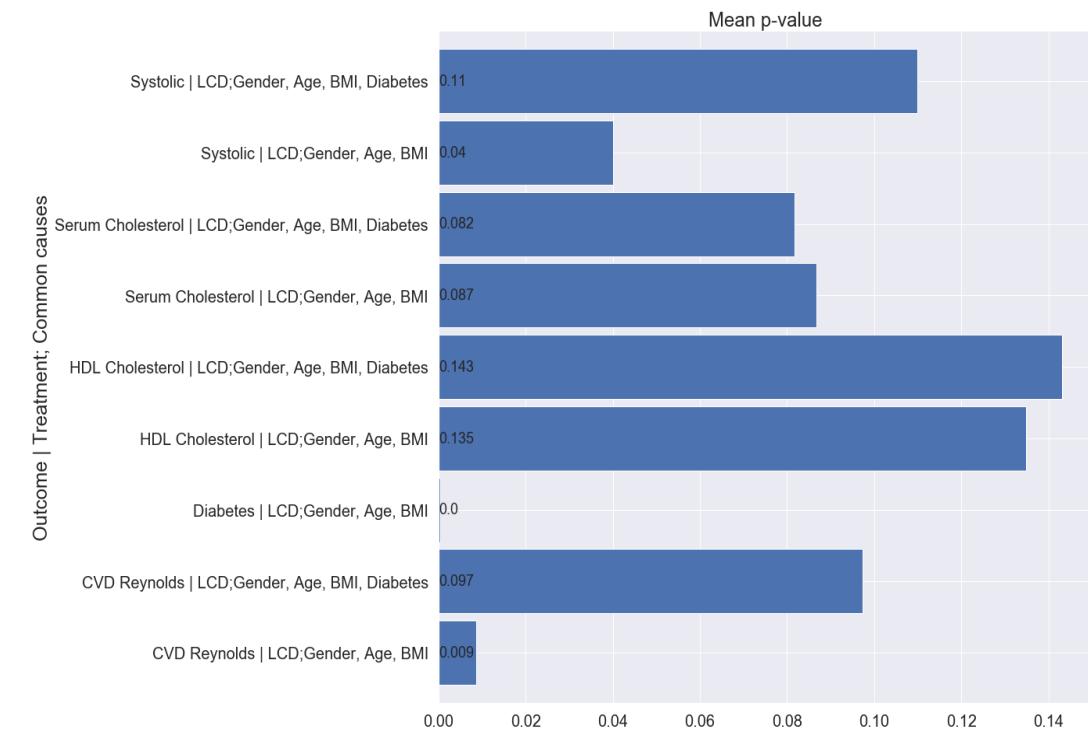

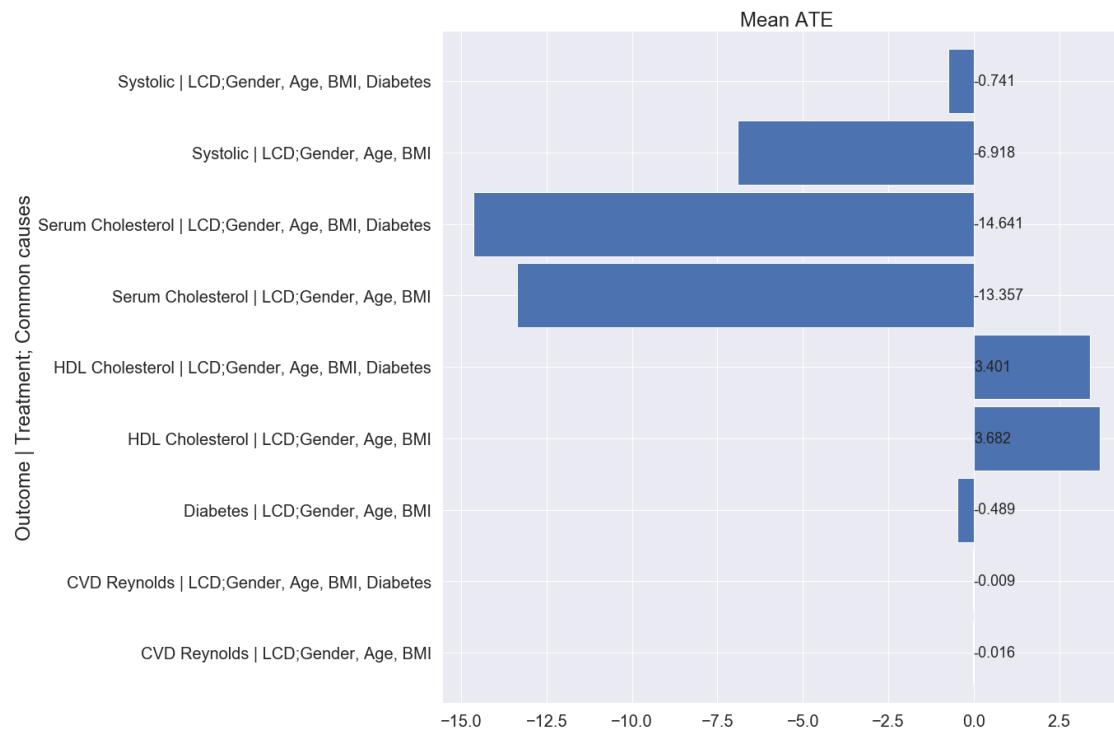

# Low-Carb is promising for lowering CVD risk !

RRS | LCD; Gender, Age, BMI, T2D

Distribution of the ATE from 500 subsamples (left), from one PT (middle),  
and of the p-value from 500 PT (right)

# Low-Carb is promising for lowering CVD risk and Diabetes

# Conclusion

Develop  
randomization  
method for  
causal inference  
for CVD

**BMI** is a high-  
risk factor --  
(exercise or diet  
is better than  
fish-oil pills)

**Low-Carb** diet  
can significantly  
lower CVD risk

Thanks for  
attention! Any  
Questions?
